```php
public function index(Request $request)  1
{
    $orders = Order::all(); 2

    $result = [];
    foreach ($orders as $order) {
        $user = User::find($order->user_id); 3
        $result[] = [
            'id' => $order->id,
            'user_name' => $user->name,
            'total' => $order->total,
        ];
    }

    return response()->json($result);
}
```

1. Has request ,but missing filter order.
2. Order with ALL() , list should be having pagination for it
3. Looping to find the user detail . Should be using join to query it or belongs to many.

```php
public function store(Request $request)
{
    $order = new Order();
    $order->user_id = $request->user_id;
    $order->total = $request->total;
    $order->status = $request->status;
    $order->save();    1

    \DB::select("SELECT * FROM audit_log WHERE order_id = " . $order->id);2

    return response()->json($order);
}
```

1. Should be logical IF ELSE conditional for check the saving success or failure.
2. Unused select the query to find.

```php
public function destroy($id)
{
    $order = Order::find($id);
    $order->delete();   1
    return response()->json(['message' => 'Deleted']);
}
```

1. Should be logical IF ELSE conditional for check the delete success or failure.
